Abstract: The paper presents the dynamic evolution of the unemployment phenomenon in Romania compared with the European Union's average rate. The paper also analyses the evolution of the unemployment rate by gender and by groups of age, both in Romania and in the rest of the European Union. The conclusion of the study is that Romania has registered a decrease of the rate of employment, developing a very different evolution in respect to the situation of the European Union, where at least 13 countries registered an increase of this rate and other had a constant evolution. A very interesting phenomenon is the percent of women in the unemployment structure which follows a constantly decreasing trend from year to year.

Keywords: unemployment rate, evolution by gender, groups of age
