Abstract: In this crisis, we need strategies directed towards forward-looking solutions by means of more sustainable programs and by avoiding the present partial responses to tackle the industry's current difficulties. With approximately 24,500 companies employing directly more than 2.5 million workers, the engineering sector is by far the biggest industry sector and is on the other hand the main productivity and innovation driving sector in Europe. It is also the main contributor to added value within the EU. In a world of high capital mobility, the threat of speculative attack becomes a central issue of macroeconomic policy and within mentioned engineering industry, as it is the biggest sector.

Keywords: crisis, sustainable development, biocapacity.
