Abstract: The planning method based on A-O-N networks helps project teams to easily analyze all the elements involved in the projects (material resources, human resources, financial resources, and time), for monitoring the work done so that the proposed objectives to be achieved in optimal way and on time. This paper tries to highlight the use of the advantages of this method in a study case that presents the objectives and activities of a project on environmental issues developed over two years.

Keywords: A-O-N networks, critical path, activities, objectives, project planning
