Abstract: In a economy of subsistence which was one of the first 10 economies of the European countries, in 1989, in regards to the industrial infrastructure, adapting to „what ca still be done” is essential to prevent the definite collapse of the national economy. In a sick and corrupt state, it’s difficult to believe that a reindustrialization will take place, knowing that the industry was, is and will be fief of engineers. With the industry’s disappearance, the necessities, in the labor market, for engineering specializations specific to each industry have also disappeared. This is demonstrated by the never-ending recession, unemployment growth, shrinking working population, bankruptcy, failed privatizations, investment fell vertiginously, the local capitalism is a disaster which is developed by its own recipe, always losing, accompanied by somewhat of a democracy. Of course, we can’t point the finger at someone from the outside. The guilt is here, with us. Analysts say that the perfidy of Romanian politicians is to blame, the Romanian political class was never, in history, more detached from the people and less loving of their country.

Keywords: communication and promotion, managers and engineer economists, energetic products (petroleum), the communcation process
