Abstract: The objective of the research is to assess the need to implement an information system to alert the population in the event of emergency situations in the South-West Oltenia Region. The scientific research was carried out on a sample of 193 employees of the Inspectorate for Emergency Situations of Dolj County (ISU-Dolj) and four scientific hypotheses were tested. The research results highlighted that the IT equipment positively influences ISU-Dolj's internal communication, the complexity of the information system positively influences the efficiency of ISU Dolj employees' actions in case of emergency situations, and the age and field of employee studies influence the efficient use of the informational system in case of emergencies.

Keywords: emergency situations, informational system of emergency situations system, communication, management of emergency situations.
